Professional Summary

DevOps & Performance Engineer Professional with 2.8 years of experience in containerization using **Docker and Kubernetes**. Experienced in building and maintaining **CI/CD** pipelines with **Jenkins, GitLab CI**, and Argo CD. Worked on AWS cloud environments using Infrastructure as Code tools such as Terraform and Ansible. Proficient in Python and Bash for scripting and automation tasks. Experience in monitoring, logging, and observability using Prometheus, Grafana, and ELK/EFK stacks. Familiar with performance testing using JMeter and LoadRunner to support application scalability and stability.

Core Skills

- **Containerization & Orchestration:** Docker, Kubernetes, OpenShift.
- **CI/CD & Automation:** Jenkins, GitLab CI, Argo CD
- **Cloud Platforms:** AWS(Amazon Web Services)
- **Infrastructure as Code (IaC):** Terraform, Ansible
- **Scripting & Automation:** Python, Bash.
- **Monitoring & Observability:** Prometheus, Grafana, Cloud Watch ELK Stack (Elasticsearch, Logstash, Kibana), EFK Stack (Fluentd, Fluent Bit)
- **Performance Testing Tools:** JMeter, LoadRunner
- **Artifact Management:** Nexus 3, Docker Hub
- **Operating Systems:** Linux (RHEL, Ubuntu), Windows
- **Data Streaming:** Apache Kafka with High Availability (Multi Brokers)

Professional Experience

DevOps and Performance Engineer | [TCS] | [June 2023 – Present]

- ❖ Deployed and managed 20+ microservices **on** Kubernetes clusters, configuring deployments, services, ingress, config maps, secrets, and resource limits, improving application stability by **30%**.

- ❖ Built and maintained **multi-stage Dockerfiles** for microservices, reducing Docker image size by **40–60%** and improving container startup time by 35%.
- ❖ Implemented monitoring and observability using tools like **Prometheus, Grafana**, and application logs, tracking CPU, memory, latency, error rate, and throughput metrics across clusters.
- ❖ Used Python scripting to automate operational tasks such as log analysis, metrics collection, pod health checks, and performance data extraction, saving **8–10** hours/week of manual effort.
- ❖ Designed and implemented CI/CD pipelines using Jenkins and Git, automating build, test, image creation, and deployment workflows, reducing manual deployment effort by 70%.
- ❖ Accelerated application restart process by 40% and improved deployment efficiency by 25% through comprehensive automation of image versioning and restart procedures using Jenkins pipelines.
- ❖ Utilized GitLab for effective version control and deployment tracking, which enabled rapid rollback capabilities, reducing downtime by an average **of 30 minutes** per incident and ensuring all changes are documented and easily retrievable.
- ❖ Proactively documented 15+ tasks and solutions for a centralized knowledge base, enabling faster problem-solving for 90% of recurring issues and fostering a culture of shared learning within the team.
- ❖ Validated high availability and scalability by generating workloads **of 500–5,000+** concurrent users and achieving throughput up to 700+ TPS under peak load.
- ❖ Conducted root cause analysis (RCA) for performance issues related to application code, container resources, and Kubernetes configurations, contributing **to 20–30%** performance improvement.

PROJECTS

• 1. Automated CI/CD Pipeline for Microservices

Tech Stack: Jenkins, Git, Docker, Kubernetes, Argo CD, Harbor.

- Deployed and managed microservices-based applications on Kubernetes clusters, including pod configuration, services, ingress, and resource requests/limits for performance-critical workloads.
- Designed multi-stage Docker builds and implemented secure image lifecycle policies in Docker Hub, shrinking image size by **70%** and improving build time by **40%**.
- Integrated **Jenkins CI/CD pipelines** with Git to automate build, containerization, deployment, and execution of performance tests as part of continuous performance validation

• 2.High Availability & Performance Validation of Application

Tech Stack: JMeter, Grafana, Prometheus

- Monitored application and infrastructure performance using Kubernetes metrics, logs,

and APM/monitoring tools, analyzing **CPU, memory, latency, throughput**, and error rates.

- Performed **horizontal and vertical scaling** of applications in Kubernetes (HPA/manual scaling) to validate high availability, fault tolerance, and auto-scaling behavior under load.
- Designed and executed **load, stress, and endurance tests** to evaluate application **scalability, stability, and reliability** under peak and sustained workloads.
- Validated **high availability behaviour** by analysing application performance during node failures and traffic spikes in a distributed environment.
- Identified **performance bottlenecks** related to CPU, memory, response time, and throughput during high-load scenarios.
- Monitored system and application metrics using **Prometheus and Grafana**, including resource utilization, latency, error rates, and pod health.
- Analysed test results and shared performance insights and recommendations to improve system resilience and capacity planning.
- Deployed and maintained **Apache Kafka clusters** for real-time data streaming, ensuring fault tolerance and multi-broker high availability.

Education

Bachelor of Technology (B.Tech) in Computer Science Engineering (CSE)

[Bonam Venkata Chalamayya Engineering College] | [2018-2022]

HIGHLIGHTS

- Recognized with the *Star of the Month* award for implementing Kubernetes-based cost optimization, achieving a 20% reduction in infrastructure costs, and scaling application performance to 700 TPS, successfully validated in production environments.
- Participated and presented at various local meetups for sharing and learning from the community.
- Certified [AWS Certified CloudOps Engineer.](#)
